

# VENTILATION SYSTEMS FOR CORROSIVE ENVIRONMENTS

With more than 30 years' experience in the field of Air Pollution and Environmental Control Systems design and construction, Leatherwood Plastics is qualified to meet the challenges of today's changing industrial needs for air purification. The importance of maintaining profitable production while providing a safe, healthy environment for employees and remaining a good business neighbor to the community is our goal when designing a Pollution Control System.

Efficient and effective exhaust systems are our goal. Fans, fume scrubbers, hoods, duct and fittings must all be carefully specified, fabricated and installed. What we provide is a coordinated system at an economical price – not a collection of bargain basement, mis-matched components.

Because Leatherwood Plastics has extensive background in design, fabrication and installation of Air Pollution Control Equipment, your investment will be in a complete system which has been engineered and installed to give you years of reliable service.

With our custom-engineered exhaust systems, you can be assured that all seams and joints are sealed to prevent any possible infiltration of harmful gases, fumes or mist into work areas. Ductwork is sized in accordance with the volume and flow requirements of your specific installation. Considerations include: fan capacity, length of duct, number of turns, elbows and materials to be exhausted.

Both interior and exterior surfaces of the entire system are smooth – no edges to gather residue or reduce efficiency.

Leatherwood Plastics' production facility is located in Lewisville, Texas, but our qualified sales engineers and design specialists are ready to go wherever you need them, and are anxious to be a part of your Air Systems solution.
